Pending Nucleic Acid and/or Pending Amino Acid database searches now generate two sets of results. These databases were split into to two parts to reduce the time needed to update the databases daily. The split freed up more machine time for processing searches.

Searches run against the Nucleic Acid Pending database produce two sets of results, with the extensions, .rnpm and .rnpn

Searches run against the Amino Acid Pending database produce two sets of results, with the extensions, .rapm and .rapn

The Pending database search results should not be left in the case because they contain data that is confidential.

According to the Pre Publication Rules, every patent application received by the United States Patent and Trademark Office after November 29, 2000 will be pre-published at eighteen months from the effective filing date. When the application is published the contents, including the sequences, will become prior art.

Two new databases have been created to hold the pre-published sequences:

Published_Applications_NA contains nucleic acid sequences; the search results will have the extension .rnpb.

Published_Applications_AA contains amino acid sequences; the search results will have the extension .rapb.

Each pre-published application is given a unique Publication Number. An example of a Publication Number is US20021234567A1. The "US" indicates the application was a U.S. application. The first 4 digits show the calendar year the application was published. The next 7 digits represent when the application was published. This 7-digit number starts at zero at the beginning of each calendar year. Each application published is given the next number in order. The "A" indicates a utility patent application and the "1" shows that this was the first time the application had been published. If the applicants submit changes to the application, they may requests that the changed application be published again. In such instances, the "1" at the end of the number would be replaced by a "2".

Sequences in the PGPub database are public information; it is permissible to leave these results in the case.

                                                                                                                                    NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                         Sequencing vector: M13; 2%
Sequencing vector: plasmid; 98%
Chemistry: Dye-primer ET; 0% of reads
Chemistry: Dye-terminator B19 Dye; 100% of reads
Assembly program: Phrap; version 0.990319
Consensus quality: 17371 Dases at least Q40
Consensus quality: 173768 bases at least Q20
Insert size: 173000; agarose-fp
Insert size: 173000; agarose-fp
Insert size: 17402; sum-of-contigs
Quality coverage: 12.07 in Q20 bases; sum-of-contigs

This sequence is the entire insert of clone RP11-382H24 The true .
This sequence is the entire insert of clone RP11-382H24 The true .
This sequence is the entire for at 135950 in this sequence. The true right end of clone RP11-187K14 is at 53851 in this sequence.
This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chamistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. RP11-382H24 is from the library RPCI-11.2 constructed by the group of Pleter de Jong.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. On Jul 1, 2000 this sequence version replaced gi:8653807.

During sequence assembly data is comparated from overlapping clones.

Where differences are found these are annotated as variations

together with a note of the overlapping clone name. Note that the

variation annotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences with

only a small overlap as described above.

The following abbreviations are used to associate primary accession

numbers given in the feature table with their source databases:

prediction programs including GRAIL (ftp://arthur.epm.ornl.gov/pub/xgrail), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, Mashington), Genscan (Chris Burge, Mashington), Genscan (Chris Burge, Mashington), Genscan (Chris Burge, Mathington), Genscan (Chris Burge, Manotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by two or more gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Proteins. Genes encoding tRNAs are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/RepeatMasker.html). Genes are numbered from the top to bottom of the chromosome.

We thank the CSHL/WashU/ABI consortium for sequencing BAC clones F6P23, F5J6, T17A5, and T13L16, the ESSA group for sequencing clone F13D4, and Scott Jackson, Jiming Jiang, Klaus Meyer, Eric Richards and Satoshi Tabata for helpful assistance. In addition, we would like to thank the TIGR Bioinformatics Department, especially Lixin Zhou, Hanif Khalak, Michael E. Heaney, Lily Fu, Feng Liang, Jeremy Peterson, Michael Holmes, and Delwood Richardson for software and

NOTE: This is a 'working draft' sequence. It currently consists of 50 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Consensus quality: 185044 bases at least Q40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          οy
                                                                                                                                                                                                                                                                                                                                                                                       5
                                                                                                                       This is the nucleotide sequence of the 5' untranslated region of the novel corn fad2-2 gene that codes for delta-12 desaturase (see AAY32344). The invention generally relates to the preparation and use of nucleic acid fragments comprising all, or substantially all, of a corn oteosin promerer (see AA235165-77), a stearcy1-ACP desaturase (see AA235199-80) and a delta-12 desaturase, which can be used individually or in combination to modify the lipid profile of corn. Suppression of delta-12 desaturase expression can increase the oleic acid content of the seed oil. Also claimed are seeds of such plants, oil obtained from the grain of such plants, animal feed, use of the oil in food, feed, and cooking oil or industrial applications. The promoter region of fad2-2 may be used to express a gene of interest in transgenic corn plants.

The present invention relates to the isolation of plant regulatory sequences from the male reproductive tissues of corn (Zea mays). The promoter sequences, fragments, regions or cis elements of the sequences, capable of regulating transcription of an operably linked DNA sequence. The promoter sequences confer enhanced expression of operably linked genes in monocot or dicot male reproductive tissues, such as an thers, especially wheat anthers and is useful for regulating transcription of a DNA sequence, by operably linking the DNA sequence. The promoter sequences are useful in plants to regulate transcription of target genes including genes for control of fertility, insect or pathogen tolerance and herbicide tolerance. They are also useful as probes or primers in nucleic acid hybridisation experiments. The promoter sequences can be used in hybridisation assays of other plant tissues to identify closely related or homologous genes and associated regulatory sequences. AASSPSSB-AASSPSST represent the

The present invention relates to novel corn promoter sequences (see expression of a second polynucleotide molecule in a transgent plant tissue. In addition, the promoter sequences are useful for providing plants with herbicide resistance. The promoter sequences are useful for providing plants with herbicide resistance. The promoter sequences are suitable for selectively modulating expression of any operatively linked gene and provide additional regulatory element diversity in a plant expression vector in gene stacking approaches. The present sequence is one such corn promoter sequence is one such corn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             heterologous gene expression in plants, comprising regulatory sequences located upstream to plant DNA structural coding sequences

Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CPG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic diagnosis and/or prognosis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease, arthritis, solid tumours and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid returned and attendant Alzheimer's disease, AlDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1416 TTAATCAAAATACTCTAAACTCAACTCAACAATAAAAACTACATATCTATATACA 1357

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute mysloid leukaemia, Alzheinmer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              372 ICICCAACAACITIACCIAITCIACATIGITCIAITICGAAITICACICIAIAAACAACA 431

genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, ansemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AlDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 6938 TTAAAATATAACCTATTTACTTAAATATTAAAATATATATACACTAAATATATTTACCCA 6879

The present invention describes a library of human polynucleotides

C comprising the sequences given in AA21253 to AA21779. Also described is

a method of detecting differentially expressed genes correlated with the

cancerous state of a mammalian cell, comprising detecting at least one

differentially expressed gene product in a test sample from a cell

suspected of being cancerous, where the gene product is encoded by one

of the 5248 polynucleotide sequences given in AA212532 to AA21779. The

of the 5248 polynucleotide sequences given in AA212532 to AA21779. The

of the 5248 polynucleotides can be used as a source of primers and probes, which can

c polynucleotides can be used as a source of primers and probes, which can

c mapping, tissue typing or profiling, forensics, genetic analysis and

detection of polynorphisms. Polypeptides encoded by the polynucleotides

can be used for raising antibodies for experimental, diagnostic and

therapeutic purposes. The polynucleotides may also be used to construct

arrays for diagnostics (which may be used to determine function of an

encoded protein); and to detect differences in expression levels between

two cells (e.g. to identify abnormal or diseased tissue in a human, to

identify a genetic predisposition or susceptibility to a disease such as

encoding a novel polypeptide (AAG64527) useful in antisense-therapy and gene-therapy, in diagnostics, forensics, gene mapping and identification of mutations responsible for genetic disorders and other traits. Polynucleotide sequences with potential homology were also identified (AAH93283-AAH93385).
                                                                                                                                                                                                                                                                                   208 ITCTGTTCTTCTTATTTGTGCATATTTTTATTGTTGTTTACTGATTATACGAGTAGTTAT 267

The invention relates to human polynucleotides encoding proteins

The invention relates to human polynucleotides encoding proteins

Expected with ovarian and endometrial cancers. The polynucleotides and

the proteins they encode may be used in the prevention, diagnosis and

treatment of diseases associated with the inappropriate expression of

covarian and endometrial cancer polypeptides (OECPS). For example, the

polynucleotide (or an expression vector comprising the polynucleotide)

cand the OECP may be used to treat disorders associated with decreased

and the OECP may be used to treat disorders associated with decreased

can fifet the activity of OECPs by expressing inactive proteins or to

supplement the patients own production of them. Additionally, the

couplynucleotide may be used to produce the OECPs, by inserting the nucleic

polynucleotide and its complementary sequences may also be used as DNA

couplement incleded and its complementary sequences may also be used as antigens in

couple of restorative therapy. The OECPs may also be used as antigens in

the production of anti-OECP antibodies and in assays to identify

antagonists may also be used to down requilate expression and activity.

The anti-OECP antibodies may also be used as diagnostic agents for

the production the presence of OECP in samples (e.g. by enzyme linked

immunosorbant assay (ELISA)) and hence diagnose patients with

contracting the present sequence is a ovarian and endometrial cancer linked

contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     211 TGTTCTTCTTATTTGTGCATATTTTTATTGTTTACTGATTATACGAGTAGTTATACA 270

                                                                                                                                                                                                                                          The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disporders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AnDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

                                                                                                                                                                                                                                                                                                                                                                      1;
                                                                                                                                                                                              The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid theumant Alzheimer's disease, ADIS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum.

Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

CC (I) and (II) are useful for the development of vaccines against

CC (I) and infection. (I) and polycional antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in consequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite biology, a process hampered by the complexity of the parasite biology, a process hampered by the complexity of the parasite in parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and mosquito drugs. AAA70078 to AAA70287 and AABB1814 to AAB18352 represent nucleotide and protein sequences given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2403 TTTTGAAAATTCATTCAATATATATTTCATATAAATTGAAAGATATTATACACATTCCA 2344

18 bases of a chemically pretreated gene associated with gene requiation selected from 43 known genes (or complementary sequences). The chemical pretreatment converts cytosine bases unmethylated at the 5-position to uracil or another base with hybridisation behaviour dissimilar to cytosine, to enable analysis of cytosine methylations. The DNA sequences, oligomers (or seta/arrays) and method are useful in the diagnosis of diseases (or predisposition to diseases) associated with gene regulation and in therapy of such diseases, by kits are provided. They are especially useful in diagnosis and therapy of e.g. severe combined immunodeficiency disease, cardiac althma, HDR syndrome, Saethre-Chotzen syndrome, renal disease, preclampsia, graft versus host disease. The present sequence is a sescitated with the human gene regulation associated genes.

Stephen and the sequence data for this specification and is associated with the human gene regulation-associated genes.
Human; Gene regulation-associated gene; severe combined immunodeficiency; cardiac damage; inflammatory response; Haemophilatis Werner syndrome; asthma; HDR syndrome; congenital heart defect; Saethma: HDR syndrome; congenital heart defect; Saether-Chotzen syndrome; renal disease; Preeclampsia, cardiac allograft vascular disease; colorectal cancer; thyroid cancer; escophageal cancer; ds; tumour; immunostimulant; cardiant; antiinflammatory; coagulant; antiasthmatic; nephrotropic; gynecological; anti-tumour; immunosuppressive; cytostatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human breast cancer expressed polynuclectides (AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynuclectides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynuclectides and encoded polypeptides are also useful for isolating compounds with cytostatic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 14, Application US/09007119C

Sequence 14, Application US/09007119C

Patent No. 6300541

GENERAL INFORMATION:

APPLICANT: Lighfoot, David A.

APPLICANT: Marken, Khalid

TITLE OF INVENTION: Soybean Cyst Nematode Resistant Soybeans,

TITLE OF INVENTION: Soybean Cyst Nematode Resistant Soybeans and Methods of

TITLE OF INVENTION: Breeding and Identifying Resistant Plants

FILE REPRENEE: Sou Illinois 1268/2 Sequence Listing

Patent No. 6300541

CORRENT APPLICATION NUMBER: US/09/007,119C

CORRENT FILING DATE: 1998-01-14

EARLIER PAPLICATION NUMBER: 60/035,335

EARLIER PILING DATE: 1997-01-14

NUMBER OF SEQ ID NOS: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

	BH255115/c LOCUS	BH255115 374 bo DNA inear GSS 29-NAV-2AA1
	DEFINITION	RXL1BAM0001A01r Zea mays L. XLi methyl filtration maize root genomic shotgun library Zea mays genomic clone RXL1BAM0001A01r. DNA
	ACCESSION	sequence, BH255115
	VERSION	BH255115.1 GI:17150008
	SOURCE	GSS. Zea mays.
	ORGANISM	Zea mays
		Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; Liliopsida; Poales; Poaceae: PACC
	REFERENCE	Clade; Panicoideae; Andropogoneae; Zea.
	AUTHORS	Kim,S.W., Yu,Y., Lee,M.C., Yang,T.J., Main,D., Henry,D., Oates.R
		and Wing, R.A.
	TITLE	Genomic shotgun library from maize

Description

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GSS 17-DEC-2001

units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for FoscueMu'. Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B cepls were transformed and then screened on LB plates with 36 c 46 g 68 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    496 bp mRNA linear EST 30-MAY-2000
